Profile

I'm a software engineer experienced in shipping production applications end-to-end and leading product development. I'm passionate about learning new approaches or about working with new stacks.

Click here to see my portfolio, which is made using Vercel, Typescript, React, Shadcn, and some custom libraries I made.

Professional Experience

Jul 2025 – Present

WeAreReasonablePeople

Software Engineer

- I was responsible for the RND of our large language model integrations. I managed and implemented multiple end-to-end LLM integrations that reduced budgeting costs and operational tasks of our clients from concept to production using TypeScript, LangChain, Nest, and Python.
- I created an integration that received up to 300-400 documents in a week for approving data against regulations of certifications providing data to the regulation auditor, lessening budgeting and operational costs using TypeScript, LangChain, LangGraph, Vite, Tailwind, Shadcn and Python.
- I created large language model services and tooling, including document interpreters e.g. RAG, session pools, model-to-model interfaces e.g. MCP, and integrations such as chat interfaces. This includes creating pipelines that use these models, and delivering solutions that enabled clients to use them in their internal processes; helping to reduce budgeting and operational costs for our clients using the beforementioned stacks.
- I used Vercel, TypeScript, and React alongside Shadcn and Tailwind for visual demos of the applications we were making for our clients e.g. POC, MVP, etc.
- I setup our integrations using Microsoft Azure, creating resource groups, creating front-doors, and virtual machines in which we managed using the Azure CLI. We also deployed numerous applications through Azure as well.
- I created an integration that received 200-800 document manuals containing 10.000-50.000 spare parts to be sorted and processed, this integration provided maintenance data and instructions to engineers using TypeScript, LangChain, LangGraph, and Python.
- I developed a reusable framework containing microservices for these integrations that reduced delivery time from 1-2 months to 1-2 weeks for each proposal.
- I set domain-driven architecture standards for ongoing applications that shorten our development time and reduced domain-knowledge constraints.

Touch Tree

Sep 2024 – May 2025

Software Engineer

- I worked on a large-scale management platform for distributors to manage their own publications from concept to production managing around 500-1000 publications in 10 countries using TypeScript, React, Angular, Laravel, and Nest.
- I created an application that used a publication to create a web-based view for accessible reading used by 100-200 publishers using React, Adobe PostScript and Laravel.
- I worked on creating pipelines that extracted the design, layout and texts from a variety of document content; this were to be automatically converted into webpages to be readable online.
- I assisted interns in managing their responsibilities throughout their university internships, often coordinating with their academic supervisors both on-site and remotely.
- I mentored engineers on domain-driven architecture to shorten development time from 4-6 months to 1-2 months assessed mid-term and after completion of a proposal.
- I held architectural and technical mentorship responsibilities such as keeping up best practices and ensuring consistent achievement of deliverables.

Dec 2023 – Sep 2024

Software Engineer

- I managed the development of several applications for publishers to distribute magazines via a web-based catalog using TypeScript, React and PHP. This included a multi-tenant CRM for both internal purposes and external clients for managing the thousands of document pages within the application.

- I created a catalog management platform containing data metrics and advertising campaign integrations from concept to production using PHP.
- I developed white-label products for our distributor products including document management, printing, and customer viewing using TypeScript, React, Angular and PHP.
- I provided architectural changes that reduced deployment cycle time from 1-2 weeks to 3-6 days. This was done by providing our team a strict guideline on how we integrate new features; how we manage our acceptance, staging, and production environments properly; and how we write proper PR.
- I created a reporting interface to provide metrics and statistics on how users interacted with the platform; including interests, activity, and potential predictions of habits and usage-expectations.

Feb 2023 – Jul 2023
Internship

Heisa

Software Engineer

- I contributed to the development of our web applications and on an education app that helped thousands of students be able to study with learning difficulties using TypeScript, JavaScript, PHP, Laravel and React.
- I worked on conceptual designs for our websites using Figma. Here I made sure that our designs adhered to WCAG and specific guidelines to people with reading disabilities.
- I developed applications from concept to production. I helped our seniors develop these applications and actively contributed to researching and sketching out the ideas using TypeScript, Angular, React, Bootstrap, and Tailwind.
- I created services such as chat servers, notification services, and real-time chat rooms in Nest, TypeScript, PHP and Laravel.

Aug 2022 – Feb 2023
Internship

Tripany

Software Engineer

- I contributed to the development of our e-commerce platforms, implementing telemetry tracking for machinery, and managing back-end endpoints using Symfony, Typescript, and PHP. This application served as a rental-platform for renting machinery for the industrial, machine, and off-shore industry.
- I worked on setting up our billing services to the application from the webshop to our internal platform.
- I created interfaces for customer-facing e-commerce applications for product viewing e.g. rental vehicles, tools and parts using TypeScript, JavaScript and PHP.
- I worked on the designs aligned to the client and end-user needs; I made sure that designs were neat, usable, and iterable.
- I managed a part of an application that managed the viewing of around 15.000-20.000 products where I contributed on managing and interfacing this data consistently under 2 seconds.

Education

Jan 2025

Yale University

Undergraduate Coursework, Psychology and Philosophy

- Non-degree.

Sep 2023

Hogeschool Rotterdam

Bachelor of Applied Science, Software Engineering

- I attended through year 3 of coursework.

Aug 2020 – Apr 2023

Grafisch Lyceum Rotterdam

Software Engineering

Sep 2014 – Apr 2018

Grafisch Lyceum Rotterdam

Media Studies

Languages

Dutch — Native/Bilingual

English — Native/Bilingual

Courses

2025	Introduction to Psychology <i>Yale University</i> PSYC110
2025	Philosophy and the Science of Human Nature <i>Yale University</i> PHIL181
2025	Software Architecture: Domain-Driven Design <i>Linkedin</i>
2024	GitHub Career Essentials in GitHub Professional Certificate <i>Github</i>
2024	Microsoft Career Essentials in Software Development <i>Microsoft, LinkedIn</i>

Skills

Languages TypeScript, JavaScript, Python, PHP, Dart, Java	Frontend React, Vite, Material UI, Vue, Angular, Flutter, Razor, Blazor, Figma, Sketch, Tailwind	Backend Node, Flask, Django, FastAPI, Laravel, Symfony, Spring Boot, WordPress, Prisma, Mongoose, Nest	DevOps Git, GitHub, GitLab, GitHub Actions, Docker Compose, Kubernetes, SSH, Servers, Vercel
Infrastructure Amazon Web Services, Microsoft Azure, Virtual Machines, Container Apps, Cloudflare, Vercel	Databases MongoDB, MariaDB, Postgres	AI Hugging Face, OpenAI, Ollama, LangChain, OpenRouter	Architecture Domain Driven Design, Clean Architecture, Layered Architecture
